

Analysis Techniques: Flood Analysis Example with Daily Data (Log-Perason Type III Distribution)

Information to get started:

- The lesson below contains step-by-step instructions and "snapshots" of what each step looks like when carried out in a Microsoft Excel workbook. Blue shading of information in the Excel illustrations denotes changes made from the previous step. Dots placed in three consecutive rows indicate that a portion of data is hidden from sight.
 - You can download an Excel workbook containing the complete data set by clicking on the "Download Data" link below. It contains each calculation step on a separate worksheet. To move between steps, click on the tabs at the bottom of the excel window.
 - When you download the file, it may open in your browser window. You may wish to use the "save as" function to save the file to a local drive and then reopen it in Excel. This will make it easier to flip between the online lesson and the example workbook.
 - Finally, we want to remind you that the techniques explained on this site are statistically based; therefore results must be viewed as predictions and not as facts. Please use the techniques and the information obtained from them responsibly!
-

Download Data

Step 1: Obtain streamflow data

- Obtain daily streamflow data from the USGS web site.
 - o Go to <http://oregon.usgs.gov>
 - o Select Historical Water Data
 - o Select Surface Water
 - o Select Daily Data
 - o Check box under Site Identifier for Site Name and Submit
 - o Type in Alsea under Site Name and select match any part and Submit
 - o Select gage at TIDEWATER (140306500)
 - o Select Tab-separated data
 - o Copy entire data set into Excel worksheet
 - o Paste special as text (this will separate the data into columns)
- Calculate the maximum discharge for each water year in the period of record.
- The AVERAGE, MAX, and MIN functions in excel can be used to calculate these values for each water year. It may be more efficient to calculate the mean, maximum, and minimum flows for each water year in the period of record at one time.

annual data (Sheet1 / Sheet2)

Step 3: Rank the data from largest discharge to smallest discharge.

- Add a column for Rank and number each streamflow value from 1 to n (the total number of values in your dataset).

	A	B	C	D	E	F	G	H	I	J
	WATER YEAR	MAX STREAMFLOW, Q, (CFS)			RANK	WATER YEAR	RANKED MAX STREAMFLOW, Q, (CFS)			
1					1	1965	36100			
2	1940	13300			2	1974	31000			
3	1941	9840			3	1996	29400			
4	1942	11400			4	1972	28500			
5	1943	19400			5	1999	28200			
6	1944	6920			6	1948	23400			
7	1945	15500			7	1961	22600			
8	1946	16500			8	1956	22300			
9	1947	22300			9	1947	22300			
10	1948	23400			10	1966	22000			
11	1949	21200			11	1981	21900			
12	1950	15400			12	1953	21500			
13	1951	16100			13	1949	21200			
14	1952	18100			14	1983	21100			
15	1953	21500			15	1997	20900			
16	1954	18400			16	1982	20800			
17	1955	13900			17	1964	19600			
18	1956	22300			18	1943	19400			
19	1957	11800			19	1978	19200			
20	1958	17300			20	1960	18900			
21	1959	17400			21	1971	18700			
22	1960	16900			22	1954	18400			
23	1961	22600			23	1952	18100			
24	1962	13100								
25	.	.								
26	.	.								
27	.	.								
58	1993	7540			58	1993	7540			
59	1996	6060			59	1991	7470			
60	1999	28200			60	1977	7360			
61	2000	17400			61	1944	6920			

Step 4: Create a column with the log of each max or peak streamflow using the Excel formula {log (Q)} and copy command.

	A	B	C	D	E	F	G	H	I	J	K	L	M
	Rank	Water Year	Ranked Max Streamflow, Q, (cfs)	log Q (cfs)									
1													
2	1	1965	36100	4.558									
3	2	1974	31000	4.491									
4	3	1996	29400	4.468									
5	4	1972	28500	4.455									
6	5	1999	28200	4.450									
7	6	1948	23400	4.369									
8	7	1961	22600	4.354									
9	8	1947	22300	4.348									
10	9	1956	22300	4.348									
11	10	1966	22000	4.342									
12	11	1981	21900	4.340									
13	12	1953	21500	4.332									
14	13	1949	21200	4.326									
15	14	1983	21100	4.324									
16	15	1997	20900	4.320									
17	16	1982	20800	4.318									
18	17	1964	19600	4.292									
19	18	1943	19400	4.288									
20	19	1978	19200	4.283									
21	20	1960	18900	4.276									
22	21	1971	18700	4.272									
23	22	1954	18400	4.266									
24	23	1952	18100	4.258									
25	.	.	.	.									
26	.	.	.	.									
27	.	.	.	.									
58	58	1993	7540	3.877									
59	59	1991	7470	3.873									
60	60	1977	7360	3.867									
61	61	1944	6920	3.840									

Step 5: Calculate the Average Max Q or Peak Q and the Average of the log (Q)

Microsoft Excel - step5flood

69								

Step 12: Calculate k values

- Use the **frequency factor table** and the skew coefficient to find the **k values** for the 2,5,10,25,50,100, and 200 **recurrence interval**
- If the skew coefficient is between two given skew coefficients in the table than you can linearly extrapolate between the two numbers to get the appropriate k value. To view the frequency factor table click on the button below.

Step 14: Create table of Discharge values found using the log – Pearson analysis

Microsoft Excel - step14flood

Return Period (years)	Skew Coefficient K(-0.3314)	Discharge Q (cfs)
2	0.0550	18111
5	0.8536	21695
10	1.2406	25061
25	1.6314	28969
50	1.8724	31714
100	2.0804	34270
200	2.2648	36707

Flood Frequency Calculations using log Pearson Analysis III
(period of record WY 1940-2000)

Step 15: Create Plot

- Below is a comparison of flood frequency analysis completed using mean daily data versus instantaneous discharge data. As can be seen, had you completed this analysis using instantaneous peak discharge data, the result would have been a more conservative estimation of the discharges associated with each return period.
